Subject: **Response to EPA's Request for Additional Information, dated October 30, 2008**
Kennecott Eagle Minerals Company (KEMC), UIC Permit Application Number MI-103-5W20-0002

Dear Ms. Harvey:

A letter dated October 30, 2008 was received from the United States Protection Agency (EPA) to clarify and/or supplement information provided in KEMC's UIC permit application and an earlier letter from KEMC dated August 21, 2008. In summary EPA requested information related to three items:

1. Additional information to support the degree of discontinuity and permeability of the silty-sand layer within the TWIS.
2. Submittal of additional groundwater monitoring data within the TWIS area.
3. Additional analytical information for the TWIS area sediments.

KEMC submitted responses to items #1 and #2 in letters dated November 14, 2008 and November 21, 2008. Consistent with our correspondence dated November 14, 2008, and in complete fulfillment of EPA's request for data, please find attached a response to item #3.

Should you have any questions, please contact me at 906-486-1257.

Sincerely,

Jonathan C. Cherry, P.E.
General Manager

TECHNICAL MEMORANDUM

DATE: 19 December 2008

TO: Victoria Peacey (Kennecott Eagle Mining)

FROM: Mark J. Logsdon (Geochimica)

SUBJECT: EPA Method 1312 Leaching of Alluvial Sediment and Baseline Water Quality: Additional Responses to EPA for Eagle Mine's Underground Injection Control Permit Application

BACKGROUND

Kennecott Eagle Mining Company (KEMC) has applied for state and federal permits to operate an underground mine. The U.S. Environmental Protection Agency (EPA) is completing its review of KEMC's submissions for an underground injection control (UIC) permit to dispose of treated mine water to the shallow alluvium adjacent to the mine site. Based on earlier submissions and discussions between KEMC and the EPA staff, there remains one question that requires further site-specific evaluation. EPA Staff and their contractors asked KEMC to evaluate directly the potential for leaching of metals from the Quaternary alluvium into which the treated water would be discharged.

Purpose and Objectives

The purpose of this memorandum is to document the analytical results of the supplemental test work and to describe further the existing baseline water quality of the alluvial sediment into which KEMC proposed to discharge its treated water.

TECHNICAL APPROACH

The chemistry of the TWIS Quaternary alluvial sediments is analyzed for four new samples from core hole QAL-041, which was previously analyzed for mineralogy and submitted to EPA in a letter dated August 21, 2008 (Mineralogy of Till Samples from Hole QAL-041 by Dr. Rodney C. Johnson). Splits of those samples were submitted for laboratory analysis by EPA Method 1312 leach procedure to assess how infiltrating water derived from natural precipitation would interact with representative samples of alluvial TWIS sediments. The results of those Method 1312 leaching tests are discussed in the context of systematic evaluation of the water quality of the injection zone, based on 6 months of water-quality data from fifteen (15) water-quality monitoring stations that are the database for KEMC's groundwater discharge permit application (GW1810162) with the State of Michigan. This 6-monthly groundwater data report (2008 Background Water Quality Report for groundwater

Discharge Permit GW1810162) was also submitted to the EPA in a letter dated November 14, 2008.

METHODS, PROCEDURES, AND RESULTS

To address the leachability question, KEMC geologists collected four samples of the Quaternary alluvium within core hole QAL-041 from the footprint of the zone into which discharge is proposed. The four samples were analyzed for total metals concentrations (using EPA 6000/7000 series methods) and also leach tested using EPA Method 1312, the Synthetic Precipitation Leaching Procedure, with extract solutions analyzed by the EPA 6000/7000 methods. A full copy of the analytical report for the work (conducted by Tri-Matrix Laboratories, Grand Rapids, MI) is provided at Attachment A.

The KEMC geologists chose the core hole to provide a representative sample of the TWIS area sediments to include both fine sands and fine sands/silts and clays and to address both shallow (14'-18'; 24'-28') and deep (52'-54'; 54'-58') sections of the alluvium. The shallow core samples are comprised of unsaturated outwash sands, with over 70% fine sand by weight, while the deep core samples are comprised of transitional fine sand and 22% silt and clay. The soil boring log and standard sieve analysis data for QAL-041 are contained in Attachment B and sourced from the Supplemental Hydrogeological Study Report (North Jackson Company, 2006).

When KEMC discussed this testing program with the EPA project officer on October 20, 2008, they agreed that any discharge water infiltrating through the alluvium must contact both finer and coarser fractions and thus whole sample total metals and SPLP analysis was completed for the TWIS core samples. The flow-weighting during infiltration will be associated with the actual permeability distribution that will exist across the entire discharge zone, a matter that cannot be described in significant detail from surface drilling. By leach-testing the entire soil sample in batch mode, it is likely that there is more contact with fines than would be the case in an in-situ soil, through which water flux is dominated by flow through higher permeability zones that would be associated with the coarser sediment fractions.

The existing water quality of the injection zone has now been systematically assessed using and additional 6 months (May through October, 2008) of water-quality data from fifteen (15) water-quality monitoring stations that are the database for KEMC's groundwater-discharge permit application (GW1810162) with the State of Michigan. The entire report, prepared by North Jackson Company (Marquette, MI), including all data and their statistical analysis, was submitted to EPA in a letter dated November 14, 2008.

Please note that the data for both the core hole soil samples and the groundwater evaluation include full quality assurance/quality control reports documenting the reliability of the data.

RESULTS

Table 1 summarizes the key results for the four samples of the Quaternary alluvial sediment, focusing on the ten “drinking-water metals”, as both total-metal and SPLP-leachable values.

Table 1 Summary of Total and Leachable Metals, Quaternary Alluvial Sediments

Sample	Metal	Total (mg/kg)	SPLP (mg/L)		Sample	Metal	Total (mg/kg)	SPLP (mg/L)

For the baseline water-quality study, North Jackson measured 15 monitoring wells, monthly for six months. Full data are in the report. To summarize a large and complex data set, we will follow North Jackson’s approach of using parametric indicators, the average, maximum, and 95th percentile upper confidence interval critical value. In Table 2, we present these for the ten “drinking-water metals”, as the maximum value (in each category) for any well in any of the six months tested. For example, consider copper (Cu) in Table 2. The highest average value for any well in any month was 1.0 ug/L; the highest reported value in any month for any well was 2.5 ug/L, and the highest computed 95th percentile Upper Confidence Interval value for any well was 2.3 ug/L. Note that in Table 1, the SPLP values are reported in mg/L; for direct comparison to Table 1’s SPLP results, divide each number in Table 2 by 1,000, except Hg by 1,000,000.

Table 2 Summary of Baseline Water Quality.

Metal	Highest Average	Highest Maximum	Highest 95% UCL
<i>As</i>	7.1	7.7	7.4
<i>Ba</i>	10.8	19	15
<i>Cd</i>	<0.20	<0.20	<0.20
<i>Cr</i>	1.9	5.9	5.2
<i>Cu</i>	1.0	2.5	2.3
<i>Pb</i>	<1.0	<1.0	<1.0
<i>Hg</i>	1.54	2.37	2.32
<i>Ni</i>	4.8	10.0	7.5
<i>Se</i>	0.7	1.6	1.4
<i>Ag</i>	<0.20	<0.20	<0.20

The posted values are the maximum ones reported in each category for any of the fifteen wells in any of the six months from May to October, 2008. Concentrations in ug/L, *except Hg in ng/L*. Please see 2008 Background Water Quality Report for groundwater Discharge Permit GW1810162, submitted to the EPA in a letter dated November 14, 2008 for full discussion of North Jackson's statistical analyses that go into Table 2.

DISCUSSION

Total metal concentrations, across the whole range of analytes, in the four samples of alluvial sediment obtained from QAL-041 are fully consistent with the values reported in the earlier KEMC submittals. All samples are very low in concentration, and are well within the range of normal rocks and sediments in the upper crust.

The SPLP tests were run on both outwash and transitional formation samples, where the shallow samples are dominantly fine sand outwash with low percentages of silt and clay and the deeper samples contain a much higher percentage of fines (22% for samples that correspond with SPLP samples QAL-041-52 and QAL-041-56). Regardless of the fines content, the Method 1312 leachates are extremely low in concentration for all ten "drinking water metals", below or near detection limits. Barium is consistently the highest, but even that reports to the leachate in the low part-per-billion range. Note that Arsenic, which was a particular concern to the EPA-contractor reviewers as potentially leachable, is below the detection limit of 0.0010 mg/L (1.0 part per billion) in all four core samples.

The SPLP results are consistent with the baseline water quality data obtained from the 6-monthly sampling and the combined dataset indicates that the TWIS sediments, including areas with a higher fines content are not a large reservoir of metals that will be mobilized during infiltration. The maximum values observed in six months of data collection from fifteen alluvial wells are low parts-per-billion concentrations (parts per trillion for Hg). Note that, as with the SPLP values, Ba is the highest of the ten metals.

The contractor-reviewers had expressed concern that the treated mine water might be out of equilibrium with buried sediments containing arsenic (As) adsorbed to or co-precipitated with hydrous ferric oxide. However, because the discharge waters, like the SPLP leachate, is oxidizing and because the system has sufficient available alkalinity to buffer groundwater pH in the neutral to slightly alkaline range, ferric minerals will remain stable, and will neither preferentially dissolve nor de-sorb As.

CONCLUSIONS

The expanded sampling and testing of shallow alluvial sediments produced results consistent with the more generalized geochemistry and mineralogy summarized by KEMC earlier (letter to EPA dated August 21, 2008). The new leach testing, using EPA Method 1312, the Synthetic Precipitation Leaching Procedure, shows that the alluvial sediment yields no reportable Arsenic and low to non-detect concentrations of the other drinking-water metals. These samples included representative proportions of both finer- and coarser-grained sediment, and therefore are the best possible sample for understanding how infiltration would react as it moves through native sediments in the discharge zone. The SPLP results are fully consistent with the new, greatly expanded compilation of water-quality data for the whole of the shallow zone near the discharge area.

All data collected and analyzed to date is consistent with KEMC's evaluation of the discharge process as one that would pose no threat to existing, shallow, alluvial water quality.

TRIMATRIX ANALYTICAL REPORT

December 02, 2008

Kennecott Eagle Mineral Company
Attn: Mr. Andrew Ware
200 Echelon Drive, Suite A&B
Negaunee, MI 49866

Project: Waste Characterization

Dear Mr. Andrew Ware,

Enclosed is a copy of the laboratory report, comprised of the following work order(s), for test samples received by TriMatrix Laboratories:

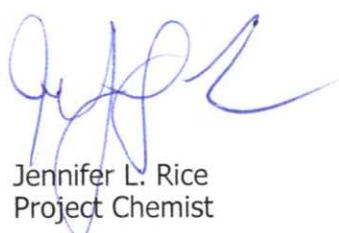

Work Order	Received	Description
0811218	11/01/2008	Laboratory Services

This report relates only to the sample(s), as received. Test results are in compliance with the requirements of the National Environmental Laboratory Accreditation Conference (NELAC). Any qualifications of results, including sample acceptance requirements, are explained in the Statement of Data Qualifications.

Estimates of analytical uncertainties for the test results contained within this report are available upon request.

If you have any questions or require further information, please do not hesitate to contact me.

Sincerely,

Jennifer L. Rice
Project Chemist

STATEMENT OF DATA QUALIFICATIONS

Total Metals by EPA 6000/7000 Series Methods

Qualification: This analyte was not present in this sample at a concentration greater than 100 times the MDL, therefore serial dilution is not required.

Analysis: USEPA-6020A

Sample/Analyte:	0811218-01 QAL-041-16 14-18'	Arsenic
	0811218-01 QAL-041-16 14-18'	Boron
	0811218-01 QAL-041-16 14-18'	Nickel
	0811218-01 QAL-041-16 14-18'	Zinc

Qualification: The MS and/or MSD recovery was outside the control limit. The non-spiked sample result is considered estimated.

Analysis: USEPA-6010B

Sample/Analyte:	0811218-01 QAL-041-16 14-18'	Silicon
-----------------	------------------------------	---------

Qualification: The MS and/or MSD recovery was outside the control limit. The non-spiked sample concentration for the same analyte was greater than or equal to 4 times the spiked amount; the non-spiked sample result is not qualified.

Analysis: USEPA-6010B

Sample/Analyte:	0811218-01 QAL-041-16 14-18'	Aluminum
	0811218-01 QAL-041-16 14-18'	Iron
	0811218-01 QAL-041-16 14-18'	Titanium

Qualification: The MS or MSD recovery, but not both, was outside the control limit. The RPD is within the control limit. The unspiked sample result is not qualified.

Analysis: USEPA-6020A

Sample/Analyte:	0811218-01 QAL-041-16 14-18'	Manganese
-----------------	------------------------------	-----------

STATEMENT OF DATA QUALIFICATIONS

SPLP Metals by EPA 1312/6000/7000 Series Methods

Qualification: The analyte concentration in the associated MB was greater than or equal to the RL. The positive sample result, which was less than 5 times the MB value, is considered estimated.

Analysis: USEPA-6020A

Sample/Analyte:	0811218-01 QAL-041-16 14-18'	Barium
	0811218-02 QAL-041-26 24-28'	Barium
	0811218-03 QAL-041-52 52-54'	Barium
	0811218-04 QAL-041-56 54-58'	Barium

Qualification: The % difference between the values of the isotopes monitored for this analyte exceeded 25%; the lower of the two results has been reported.

Analysis: USEPA-6020A

Sample/Analyte:	0811218-02 QAL-041-26 24-28'	Selenium
	0811218-03 QAL-041-52 52-54'	Chromium
	0811218-04 QAL-041-56 54-58'	Chromium

Boring/Well Construction Report

Bore Hole: QAL041

Project: Eagle

1004 Harbor Hills Drive, Suite 102 PO Box 218 Marquette, MI 49855 phone: 906.225.6787 fax: 906.225.6769

Owner: Kennecott Minerals Co.				Surface Elevation (ft MSL): 1463			
Contractor: Prosonic		Started: 7/29/2005		Total Depth (ft): 114			
Geologist: DWW, North Jackson Co.		Completed: 7/29/2005		Easting (UTM): 432930.46			
Sampling method: Sonic 4" continuous core				Northing (UTM): 5177637.78			

Depth (ft)	Core Intervals	Sample Location	Sample Number	Sample Type	Color	Blow Counts	Moisture Content	Lithologic Description		Well Construction (Sonic Rig Installation)	
0								SP	Unsaturated Outwash: sand, poorly graded, mostly fine-medium grained, loose, yellowish red		
10					SYR 5/8		moist	SP	sand, poorly graded, mostly fine-medium grained, trace gravel, loose, reddish brown		
20		EAG-1001505	grain size bag		SYR 5/4		moist	SP	sand, poorly graded, mostly fine-medium grained, 5-10% coarse mafic grains, 5% gravel, loose, light reddish brown
